The Perfect Solution for Passing Pipes Through Walls

Old Practice
The normal procedure for passing pipes through walls is to leave a substantial cut-out in the wall during the original concrete pouring process. Later, the contractor will pass a ‘puddle pipe’ through the cut-out, and build an intricate ‘letter-box’ shutter around it. New concrete is then poured into the void to encapsulate the puddle pipe. Not only is this a time consuming process, but very often the puddle pipe moves with the pour and settles to a less than suitable alignment.

Easier Installation
By utilising a Viking Johnson wall coupling which is held rigidly between the shutters, the ‘boxing out’ process is eliminated. This means that pouring the wall is a simplified and is a single step process. It also guarantees that leak paths, which are inevitably set up when new concrete is poured onto old, are completely eliminated.

Using a standard Type 1 Viking Johnson wall coupling gives a versatile coupling either side of the wall where pipes can either be passed through or inserted into each side. This system allows for misalignment or angular deflection of up to 3º on each side of the wall. In addition, the use of a Viking Johnson wall coupling ensures that, on the outside of the structure, the first ‘rocker’ or settlement coupling is built into the shear face of the wall – exactly where it is required. It also means that only one further versatile coupling is needed to form the settlement ‘rocker’ instead of two. Consequently the installed cost can be drastically reduced, particularly where a large number of through the wall joints appear on a building, for instance in a gravity treatment works.

Structural Strength of Concrete Wall
Viking Johnson strongly recommends the user ensures that the wall is structurally capable of withstanding the resultant forces induced by the system working pressure and any other related influence.
Flexible Fit

Using a standard Type 1 Viking Johnson wall coupling gives a flexible coupling either side of the wall where pipes can either be passed through or inserted into each side. This allows for slight misalignment or angular deflection on each side of the wall.

Corrosion Protection

Metal components are coated with Rilsan Nylon 11 which is WRAS approved for use with potable water and offers a long term protection to corrosion, impact and abrasion to ensures continued reliable performance.

Customer Benefits

➤ Straightforward for Civil Contractor to position the pipe.
➤ Easy to secure and prevent movement of the pipe work.
➤ Large formwork panels can be reused as there is no need to make holes in the shuttering.
➤ No need for a contractor to come back and cast in pipes or 'make good' the wall surface after casting pipes.
➤ Ensures good bond between wall and pipe.
➤ Installed cost can be drastically reduced particularly where a large number of through the wall joints appear on a structure e.g. in a gravity treatment works.
Wall Couplings - Type 1

Installation Benefits

Conventional Method with a Puddle Pipe

In civil projects with reinforced concrete work & pipework it is inevitable that there will be a need to pass a pipe through a concrete wall.

Traditional methods to accommodate pipework are:-

- Box Out a section and come back later to cast in pipe.
- Cast In the Puddle Pipe, by cutting the formwork to include the pipe when pouring main wall.

Traditional Methods Disadvantages:

Boxing Out

- Make up formwork for box out that will only have one use.
- Never get a good surface finish between old and new concrete.
- Potential weak joint between old and new concrete.

Casting In

- Civil contractor has to position pipe at correct level and location in wall.
- When pouring large walls there is always a risk of movement of formwork and therefore cannot always get pipework accurately positioned.
- Formwork can only be used for one concrete pour.

In addition to the problems with casting in the puddle pipe, two flexible couplings are required along with a rocker pipe to accommodate ground movement.

Viking Johnson Wall Coupling Method

Designed to fit flush between formwork panels and coming with various end configurations to accommodate site conditions, Viking Johnson Wall Couplings provide an alternative means of passing a pipe through a wall or slab, that also offers the following advantages.

Wall Coupling Advantages:

- Easier for civil contractor to position pipe at correct level & location in wall.
- Easier to secure wall coupling to prevent risk of movement during pouring of concrete.
- Large formwork panels can be re-used.
- No need to come back to wall to cast in pipes.
- No need to “make good” wall surface after pouring secondary concrete around pipe.

In addition, the use of a Viking Johnson wall coupling ensures that, on the outside of the structure, the first ‘rocker’ or settlement coupling is built into the shear face of the wall – exactly where it is required. It also means that only one further versatile coupling is needed to form the settlement ‘rocker’ instead of two.
Wall Coupling Variations

The Viking Johnson Wall Coupling is available in nine variations:

![Wall Coupling Variations Diagram]

Materials, Relevant Standards & Approvals

**Body, Centre Sleeve & End Rings:**
- DN80 to DN300:
  - Carbon steel to BS EN 10025: Grade S275JR
  - Ductile iron to BS EN 1563: Symbol EN-GJS-450-10
  - Carbon steel to BS EN 10025: Grade S275JR

**Gasket**
- EPDM to BS EN 681 Part 1 Type WA

**Coatings**
- Wall Coupling Bodies & End Rings:
  - Standard Rilsan Nylon 11.
  - Optional - Scotchkote 206N fusion bonded epoxy.
  - Sheraplex coated to WIS 4-52-03.

**Tee Bolts or Stud**
- Steel to BS EN ISO 898-1: Property Class 4.8

**Washers**
- Stainless Steel to BS 1449: Part 2: Grade 304S15

**Approvals**
- The following water contact materials used in Wall Couplings are approved for use with potable water:
  - Rilsan Nylon 11:
    - WRAS, AS/NZS 4020, DVGW, W270, ACS & KIWA
  - EPDM Gaskets:
    - WRAS, AS/NZS 4020
